A PPP Projects Valuation: Real Options, Competition and Anchoring Bias Job Market Paper

This paper presents an integrated mathematical model for the evaluation of public-private partnership (PPP) projects, taking into account uncertainty, anchoring bias, and potential competition that may affect such investments. Before committing to a PPP project, private firms must carefully consider public opinion, as well as manage the uncertainty and possible competitive dynamics that may arise in the future. Anchoring bias is a cognitive bias in which investors have trust in a particular piece of market information, known as the anchor, when forming their investment decisions. Specifically, the paper combines the real options approach with game theory to account for competition and Natural Language Processing (NLP) techniques to capture the impact of market information disclosure. The result is an integrated model that serves as a decision-making tool for evaluating investments in PPP projects.

Corporate Social Responsibility (CSR) by small and medium enterprises (SMEs): a systematic review

Joint with Grace Bikefe, Umaru Zubairu, Simeon Araga, Faiza Maitala, Ekanem Ediuku,

Published

This study aims to systematically review the key characteristics and issues in Corporate Social Responsibility among Small and Medium Enterprises (CSRS) research. The Systematic Assessment Quantitative Technique (SQAT) developed by Australian researchers, Catherine Pickering and Jason Antony Byrne, was used to identify and analyse 62 peer-reviewed CSRS articles from six high quality academic databases. Most of the studies took place in Europe and Asia while South America has been largely ignored. A significant number of CSRS research were empirical in nature, meaning that there is a need for more conceptual studies to aid the understanding of new CSRS norms and underlying factors. Additionally, CSRS articles focused mainly on identifying the various ways SMEs are implementing CSR. Finally, most CSRS articles adopted a single research method, with survey being the most dominant method. There is a need for future studies to combine a variety of methods so as to gain additional insight into CSRS related issues.
